Write the program which handles below task.

1) Read Whole File

- Accept file name and print full content on console.
- Use a buffer loop (`read()` until 0).
- Show total bytes read.

2) Write String to File

- Accept file name and a string from user.
- Write string using `write()` (append mode by default).
- Print number of bytes written.

3) List All Files From Directory

- Accept directory name.
- Use `opendir()` / `readdir()` to print only names (skip `.` and `..`).

3) List Files with Type

- Accept directory name.
- Print each entry with its type: Regular / Directory / Link / FIFO / Socket / Char / Block
- Use `lstat()` for accurate type.

5) Find Largest File in Directory

- Accept directory name.
- Find and print:
  - largest file name
  - its size in bytes
- Consider only regular files (ignore directories).
