Write the program which handles below task.

1) Copy File Contents (source → destination)

- Accept `source_file` and `dest_file`.
- Create destination if not exists (`O_CREAT | O_TRUNC`).
- Copy using buffered `read()`/`write()` loop.
- Preserve permissions (optional bonus using `stat()` + `chmod()`).

2) Check File Present in Directory

- Accept directory name and file name.
- Check whether that file exists in that directory.
- Print absolute matched path if found.

3) Move All Files (Dir → Dir)

- Accept source dir and destination dir.
- Move all regular files:
  - Use `rename()` if same filesystem
  - Else copy + delete
- Print count of moved files.

4) Delete All Empty Regular Files

- Accept directory name.
- Delete files with size = 0 bytes (regular files only).
- Print names deleted + total deleted count.
