Write the program which handles below task.

1. File Copy Utility

Problem Statement:
Write a program that copies the contents of one file into another.

Input:
Source file name and destination file name as command-line arguments.

Output:
Destination file containing an exact copy of source file.

- Handle file-not-found and permission errors.
- Destination file should be created if not present.

2. File Copy with Offset

Problem Statement:
Copy a file starting from a given byte offset of the source file.

Input:
```
source_file destination_file offset
```

Output:
Partial file copied starting from offset.

3. File Copy Using pread & pwrite

Problem Statement:
Copy a file using `pread()` and `pwrite()` without changing the file offset.

Input:
Source and destination file names.

Output:
Copied file identical to source.

4. File Merge Utility

Problem Statement:
Merge multiple input files into a single output file.

Input:
```
output_file file1 file2 file3 ...
```

Output:
Combined file content in order.

5. Reverse File Content

Problem Statement:
Display the contents of a file in reverse order.

Input:
File name.

Output:
File content printed in reverse.
